LibreOfficeKit GTK+ Widget

```
#include <LibreOfficeKit/LibreOfficeKitGtk.h>
// Only include once where lok_init is called:
#include <LibreOfficeKit/LibreOfficeKitInit.h>

...

// Manage your own LOK instance
LibreOfficeKit* pOffice = lok_init( "path/to/LO" );
LOKDocView* pDocView = lok_docview_new( pOffice );

// add to your gtk+ window/whatever here.

lok_docview_open_document( pDocView, "path/to/document" );

// Some convenience methods (but liable to change...)
lok_docview_set_zoom( pDocView, 2.0 );
lok_docview_set_part( pDocView, 2 ); // Select slide or sheet.

// read LibreOfficeKitGtk.h for the full API, input welcome...
```

LibreOfficeKit GTK+ Widget

- **Linux only** for now...
- Just renders one huge tile:
 - Some proper tile compositing would be nice.
- Test using the **gtktilviewer**:

```
./instdir/program/gtktilviewer \
INSTDIR_PATH/program \
DOC_PATH
```
